Contents

Word

This documents the Word module and how to use it from JavaScript flows.

You can load the module using the following code:

```
1  var c = Module.load("Word", {version: "X.Y.Z"});
```

Inspect a document

To parse and inspect a document, use the `inspect` method:

```
1  var doc = c.inspect("path/to/document.docx");
```

The returned `doc` is a document-object-model of a sorts of the document in question. You can use it to retrieve all paragraphs, tables, lists, etc. in the document.

Each node in the `inspect()` output has a `type` property that indicates the type of node. The following types are supported:

- `document`: the root node of the document
- `paragraph`: a paragraph
- `table`: a table
- `list`: a list
- `listitem`: an item in a list
- `text`: a text node
